

POSTWEANING MULTISYSTEMIC WASTING SYNDROME  
VIRUS FROM PIGS

Abstract of the Disclosure

5           The cloning of a novel PCVII viral genome is  
described as is expression of proteins derived from the  
PCVII genome. These proteins can be used in vaccine  
compositions for the prevention and treatment of PCVII  
infections, as well as in diagnostic methods for  
10 determining the presence of PCVII infections in a  
vertebrate subject. Polynucleotides derived from the  
viral genome can be used as diagnostic primers and  
probes.
